This document is an Internet-Draft. Internet-Drafts are working documents of the Internet Engineering Task Force (IETF), its areas, and its working groups. Note that other groups may also distribute working documents as Internet-Drafts.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as ‘‘work in progress.’’

To learn the current status of any Internet-Draft, please check the ‘‘id-abstracts.txt’’ listing contained in the Internet-Drafts Shadow Directories on ftp.is.co.za (Africa), nic.nordu.net (Europe), munnari.oz.au (Pacific Rim), ds.internic.net (US East Coast), or ftp.isi.edu (US West Coast).

This memo provides information for the Internet community. This memo does not specify an Internet standard. Distribution of this memo is unlimited.

Abstract

This document provides two sets of test cases for HMAC-MD5 and HMAC-SHA-1, respectively. HMAC-MD5 and HMAC-SHA-1 are two constructs of the HMAC [HMAC] message authentication function using the MD5 [MD5] hash function and the SHA-1 [SHA] hash function. Both constructs are used by IPSEC [OG,CG] and other protocols to authenticate messages. The test cases and results provided in this document are meant to be used as a conformance test for HMAC-MD5 and HMAC-SHA-1 implementations.
1. Introduction

The general method for constructing a HMAC message authentication function using a particular hash function is described in section 2 of [HMAC]. We will not repeat the description here. Section 5 of [HMAC] also discusses truncating the output of HMAC; the rule is that we should keep the more significant bits (the bits in the left, assuming a network byte order (big-endian)).

In sections 2 and 3 we provide test cases for HMAC-MD5 and HMAC-SHA-1, respectively. Each case includes the key, the data, and the result. The values of keys and data are either hexadecimal numbers (prefixed by "0x") or ASCII character strings in double quotes. If a value is an ASCII character string, then the HMAC computation for the corresponding test case DOES NOT include the trailing null character (\"\0\") in the string.

The C source code of the functions used to generate HMAC-SHA-1 results is listed in the Appendix. Note that these functions are meant to be simple and easy to understand; they are not optimized in any way. The C source code for computing HMAC-MD5 can be found in [MD5]; or you can do a simple modification to HMAC-SHA-1 code to get HMAC-MD5 code, as explained in the Appendix.

2. Test Cases for HMAC-MD5

test_case = 1
key = 0x0b0b0b0b0b0b0b0b0b0b0b0b0b0b0b0b
key_len = 16

Appendix

This appendix contains the C reference code which implements HMAC-SHA-1 using an existing SHA-1 library. It assumes that the SHA-1 library has similar API's as those of the MD5 code described in RFC 1321. The code for HMAC-MD5 is similar, just replace the strings "SHA" and "sha" with "MD5" and "md5". HMAC-MD5 code is also listed in RFC 2104.

```c
#ifndef SHA_DIGESTSIZE
#define SHA_DIGESTSIZE  20
#endif

#ifndef SHA_BLOCKSIZE
#define SHA_BLOCKSIZE   64
#endif

#ifndef MD5_DIGESTSIZE
#define MD5_DIGESTSIZE  16
#endif

#ifndef MD5_BLOCKSIZE
#define MD5_BLOCKSIZE   64
#endif

/* Function to print the digest */
void pr_sha(FILE* fp, char* s, int t)
{
    int i;

    fprintf(fp, "0x") ;
    for (i = 0 ; i < t ; i++)
        fprintf(fp, "%02x", s[i]) ;
    fprintf(fp, "0) ;
}

void truncate
{
    char* d1, /* data to be truncated */
    char* d2, /* truncated data */
    int len /* length in bytes to keep */
}
{
    int i;
    for (i = 0 ; i < len ; i++) d2[i] = d1[i];
}
```
/ Function to compute the digest 

```c
void hmac_sha(
    char*    k,     /* secret key */
    int      lk,    /* length of the key in bytes */
    char*    d,     /* data */
    int      ld,    /* length of data in bytes */
    char*    out,   /* output buffer, at least "t" bytes */
    int      t)
{
    SHA_CTX ictx, octx;
    char  isha[SHA_DIGESTSIZE], osha[SHA_DIGESTSIZE];
    char   key[SHA_DIGESTSIZE];
    char   buf[SHA_BLOCKSIZE];
    int    i;

    if (lk > SHA_BLOCKSIZE) {
        SHA_CTX         tctx;
        SHAInit(&tctx);
        SHAUpdate(&tctx, k, lk);
        SHAFinal(key, &tctx);

        k = key;
        lk = SHA_DIGESTSIZE;
    }

    **** Inner Digest ****
    SHAInit(&ictx);

    /* Pad the key for inner digest */
    for (i = 0 ; i < lk ; ++i) buf[i] = k[i] ^ 0x36;
    for (i = lk ; i < SHA_BLOCKSIZE ; ++i) buf[i] = 0x36;
    SHAUpdate(&ictx, buf, SHA_BLOCKSIZE);
    SHAUpdate(&ictx, d, ld);
    SHAFinal(isha, &ictx);

    **** Outer Digest ****
    SHAInit(&octx);

    /* Pad the key for outer digest */
```
for (i = 0 ; i < lk ; ++i) buf[i] = k[i] ^ 0x5C ;
for (i = lk ; i < SHA_BLOCKSIZE ; ++i) buf[i] = 0x5C ;

SHAUpdate(&octx, buf, SHA_BLOCKSIZE) ;
SHAUpdate(&octx, isha, SHA_DIGESTSIZE) ;

SHAFinal(osha, &octx) ;

/*@ truncate and print the results */
t = t > SHA_DIGESTSIZE ? SHA_DIGESTSIZE : t ;
truncate(osha, out, t) ;
pr_sha(stdout, out, t) ;
}
