Status of this Memo

This Internet-Draft is submitted to IETF in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF), its areas, and its working groups. Note that other groups may also distribute working documents as Internet-Drafts.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

The list of current Internet-Drafts can be accessed at http://www.ietf.org/ietf/1id-abstracts.txt.

The list of Internet-Draft Shadow Directories can be accessed at http://www.ietf.org/shadow.html.

This Internet-Draft will expire on June 11, 2009.

Abstract

This document is intended to register new cipher suites for the Transport Layer Security (TLS) protocol, according to the procedure
specified in TLS Protocol standards. These cipher suites are based
on Russian national cryptographic standards - GOST R 34.10-94 and
GOST R 34.10-2001 public keys, GOST 28147-89 encryption algorithm and
GOST R 34.11-94 digest algorithm.

1. Introduction

This document proposes the addition of new cipher suites to the Transport Layer Security (TLS) protocol to support GOST R 34.11-94 digest, GOST 28147-89 encryption and VKO GOST R 34.10-94/2001 key exchange algorithms. The cipher suites defined here were proposed by CRYPTO-PRO Company for the "Russian Cryptographic Software Compatibility Agreement" community.

Algorithms GOST R 34.10-94, GOST R 34.10-2001, GOST 28147-89 and GOST R 34.11-94 have been developed by Russian Federal Agency of Governmental Communication and Information (FAGCI) and "All-Russian Scientific and Research Institute of Standardization". They are described in [GOSTR341094], [GOSTR341001], [GOSTR341194] and [GOST28147] ([GOST3431095], [GOST3431004], [GOST3431195]). Algorithms VKO GOST R 34.10-94/2001 and PRF_GOSTR3411 are described in [CPALGS].

This document defines two configurations:
- anonymous client - authenticated server (only server provides a certificate);
- authenticated client - authenticated server (client and server exchange certificates).

The presentation language used here is the same as in [TLS1.2]. Since this specification extends [TLS1.2], these descriptions should be merged with those in the TLS specification and any others that extend TLS. This means, that enum types may not specify all possible values and structures with multiple formats chosen with a select() clause may not indicate all possible cases.

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [RFC2119].

2. CipherSuite Definitions

2.1. Key Exchange

The cipher suites defined here use the following key exchange algorithms:
Key derivation algorithms based on GOST R 34.10-94 and GOST R 34.10-2001 public keys (VKO GOST R 34.10-94, VKO GOST R 34.10-2001) are described in [CPALGS].

### 2.2. PRF, Signature and Hash

The cipher suites described here use HMAC and TLS PRF, as described in section 5 of [TLS1.2], based on GOST R 34.11-94 hash function (HMAC_GOSTR3411 and PRF_GOSTR3411), with parameter set identified by id-GostR3411-94-CryptoProParamSet (refer to [CPALGS]). The same PRF MUST be used for all dependent protocols, such as [EAP-TLS].

GOST R 34.10-94/2001 signature is used for CertificateVerify message.

GOST R 34.11 digest algorithm ([GOSTR341194]) is used for CertificateVerify signature gostR3411_hash and Finished verify_data (see sections 7.4.10 and 7.4.11 of [TLS1.2])

### 2.3. Cipher and MAC

The following cipher algorithm and MAC functions are used (for details refer to Section 3.1):

<table>
<thead>
<tr>
<th>CipherSuite</th>
<th>Cipher</th>
<th>MAC</th>
</tr>
</thead>
<tbody>
<tr>
<td>TLS_GOSTR341094_WITH_28147_CNT_IMIT</td>
<td>GOST28147</td>
<td>IMIT_GOST28147</td>
</tr>
<tr>
<td>TLS_GOSTR341001_WITH_28147_CNT_IMIT</td>
<td>GOST28147</td>
<td>IMIT_GOST28147</td>
</tr>
<tr>
<td>TLS_GOSTR341094_WITH_NULL_GOSTR3411</td>
<td>-</td>
<td>HMAC_GOSTR3411</td>
</tr>
<tr>
<td>TLS_GOSTR341001_WITH_NULL_GOSTR3411</td>
<td>-</td>
<td>HMAC_GOSTR3411</td>
</tr>
</tbody>
</table>

For all four cipher suites, the use of MAC is slightly different from the one, described in section 6.2.3.1 of [TLS1.2] for standard stream ciphers, where MAC is calculated from the following data:
MACed_data[seq_num] = seq_num +
    TLSCompressed.type +
    TLSCompressed.version +
    TLSCompressed.length +
    TLSCompressed.fragment;

Cipher suites defined in this document use the same input for first
record, but for each consequent record the input from all previous
records is concatenated:

    MACed_data[0] + ... + MACed_data[n]

3. Data Structures and Computations

3.1. Algorithms

GOST 28147-89 [GOST28147] uses 256-bit key size and 8-byte IV.
Cipher suites, defined here, use GOST 28147-89 as a stream cipher in
counter mode with S-box parameter from id-Gost28147-89-CryptoPro-A-
ParamSet (see [CPALGS]) and CryptoPro key meshing algorithm.

IMIT_GOST28147 is GOST 28147-89 [GOST28147] in "IMITOVSTAVKA" mode (4
bytes)

3.2. Keys Calculation

Key calculation is done according to section 6.3 of [TLS1.2], using
PRF_GOSTR3411. The parameters are as follows:

SecurityParameters.enc_key_length = 32
SecurityParameters.mac_key_length = 32
SecurityParameters.fixed_iv_length = 8

Length of necessary key material is 144 bytes.

3.3. Server Certificate

For these cipher suites this message is required and it MUST contain
a certificate, with a public key algorithm matching
ServerHello.cipher_suite.

3.4. Server Key Exchange

This message MUST NOT be used in these cipher suites, because all the
parameters necessary are present in server certificate (see [CPPK]).
3.5. Certificate Request

This message is used as described in section 7.4.4 of [TLS1.2], and extended as follows:

```plaintext
enum {
    gostr341094(21), gostr34102001(22), (255)
} ClientCertificateType;
```
gost341094 and gost34102001 certificate types identify that the server accepts GOST R 34.10-94 and GOST R 34.10-2001 public key certificates.

```plaintext
enum{
    gostr3411(XX)
} HashAlgorithm;
```
gostr3411 hash type identifes that the server accepts GOST R 34.11-94 hash function. It is RECOMMENDED to populate CertificateRequest.certificate_hash only with gostr3411 value, when one of the cipher suites described in this document is chosen.

The server SHOULD populate supported_signature_algorithm field with SignatureAndHashAlgorithm pairs, where HashAlgorithm equals gostr3411 and SignatureAlgorithm matches corresponding ClientCertificateType.

3.6. Client Key Exchange Message

This message is used as described in section 7.4.7 of [TLS1.2], it is required for these suites, and contains DER-encoded TLSGostKeyTransportBlob structure [X.660].

```plaintext
enum { vko_gost } KeyExchangeAlgorithm;
```

```plaintext
struct {
    select (KeyExchangeAlgorithm) {
        case vko_gost: TLSGostKeyTransportBlob;
    } exchange_keys;
} ClientKeyExchange;
```

ASN1-syntax for this structure is:
TLSGostKeyTransportBlob ::= SEQUENCE {
    keyBlob GostR3410-KeyTransport,
    proxyKeyBlobs SEQUENCE OF TLSProxyKeyTransportBlob OPTIONAL
}

TLSProxyKeyTransportBlob ::= SEQUENCE {
    keyBlob GostR3410-KeyTransport,
    cert OCTET STRING
}

GostR3410-KeyTransport is defined in [CPCMS].

dataBlob.blob.transportParameters MUST be present.

dataBlob.blob.transportParameters.ephemeralPublicKey MUST be present if the
server didn’t request client certificate or client’s public key
algorithm and parameters do not match those of the recipient. Else it
SHOULD be omitted.

proxyKeyBlobs - (optional) contains key exchange for secondary
recipients (for example, for the firewall, which audits connections).

cert - contains secondary recipient’s certificate.

Actions of client:

First, the client generates a random 32-byte premaster_secret.

Then shared_ukm is calculated as first 8 bytes of digest of
concatenated client random and server random:

shared_ukm = GOSTR3411(client_random|server_random)[0..7]

Then client chooses a sender key. If
dataBlob.blob.transportParameters.ephemeralPublicKey is present, the
corresponding secret key MUST be used as a sender key. If it is
missing, the secret key, corresponding to the client certificate MUST
be used.

Using the sender key and recipient’s public key, algorithm VKO
GOST R 34.10-94 or VKO GOST R 34.10-2001 (described in [CPALGS]) is
applied to produce KEK. VKO GOST R 34.10-2001 is used with
shared_ukm as UKM.

Then CryptoPro Key Wrap algorithm is applied to encrypt
premaster_secret and produce CEK_ENC and CEK_MAC. Again, shared_ukm
is used as URM. dataBlob.blob.transportParameters.encryptionParamSet is
used for all encryption operations.
The resulting encrypted key (CEK_ENC) is placed in
keyBlob.sessionEncryptedKey.encryptedKey field, its mac (CEK_MAC) is
placed in keyBlob.sessionEncryptedKey.macKey field, and shared_ukm
(UKM) is placed in keyBlob.transportParameters.ukm field.

Actions of server:

Server MUST verify, that keyBlob.transportParameters.ukm is equal to
GOSTR3411(client_random|server_random)[0..7], before decrypting the
premaster_secret.

Server applies VKO GOST R 34.10-94 or VKO GOST R 34.10-2001,
(depending on the client public key type), and CryptoPro Key Unwrap
algorithm in the similar manner to decrypt the premaster_secret.

Server MUST verify keyBlob.sessionEncryptedKey.macKey after
decrypting the premaster_secret.

3.7. Certificate Verify

This message is used as described in section 7.4.8 of [TLS1.2]. If
the client have sent both a client certificate and an ephemeral
public key, it MUST send a certificate verify message, as a proof of
possession of the private key for provided certificate.

The TLS structures are extended as follows:

    enum { gostr341094, gostr34102001 }  
       SignatureAlgorithm;

    select (SignatureAlgorithm) {  
        case gostr341094:  
            digitally-signed struct {  
                opaque gostr341194_hash[32];
            };
        case gostr34102001:  
            digitally-signed struct {  
                opaque gostr341194_hash[32];
            };
    } Signature;

CertificateVerify.signature.gostR3411_hash =  
GOSTR3411(handshake_messages)
3.8. Finished

This message is used as described in section 7.4.9 of [TLS1.2].

\[
\text{Finished.verify\_data} = \text{PRF\_GOSTR3411(master\_secret, finished\_label, GOSTR3411(handshake\_messages))}[0..11]
\]

4. Compatibility

For historical reasons, some applications use the cipher suites specified herein with [TLS1.0], using some features of [TLS1.2], including cipher-suite dependent PRF, Finished and Certificate Verify computations.

5. Security Considerations

It is RECOMMENDED that software applications verify signature values, subject public keys and algorithm parameters to conform to [GOSTR341001], [GOSTR341094] standards prior to their use.

Use of the same key for signature and key derivation is NOT RECOMMENDED.

It is RECOMMENDED for both client and server to verify the private key usage period, if this extension is present in the certificate.

The cipher suites TLS\_GOSTR341094\_WITH\_28147\_CNT\_IMIT and TLS\_GOSTR341001\_WITH\_28147\_CNT\_IMIT proposed hereby, have been analyzed by special certification laboratory of Scientific and Technical Centre "ATLAS" in appropriate levels of target\_of\_evaluation (TOE).

It is RECOMMENDED to subject the implementations of these cipher suites to examination by an authorized agency with approved methods of cryptographic analysis.

6. IANA Considerations

This document defines the following new cipher suites, whose values presented here are used by several implementations of the same cipher suites for TLS 1.0, and were described in previous drafts. They are currently listed in the registry as reserved. IANA is requested to update the TLS Cipher Suite registry defined in [RFC5246] with these values.
CipherSuite TLS_GOSTR341094_WITH_28147_CNT_IMIT = {0x00,0x80}
CipherSuite TLS_GOSTR341001_WITH_28147_CNT_IMIT = {0x00,0x81}
CipherSuite TLS_GOSTR341094_WITH_NULL_GOSTR3411 = {0x00,0x82}
CipherSuite TLS_GOSTR341001_WITH_NULL_GOSTR3411 = {0x00,0x83}

This document defines the following new client certificate types, whose values presented here are used by several implementations of the same suites for TLS 1.0, and were described in previous drafts. They are currently listed in the registry as reserved. IANA is requested to update the TLS ClientCertificateType Identifiers Registry defined in [RFC5246] with these values.

```
enum {
   gostr341094(21), gostr34102001(22)
} ClientCertificateType;
```

This document defines the following new signature algorithm types, whose values are to be assigned from the TLS SignatureAlgorithm Registry defined in [RFC5246].

```
enum{
   gostr341094(XX), gostr34102001(XX)
} SignatureAlgorithm;
```

This document defines the following new hash algorithm types, whose values are to be assigned from the TLS HashAlgorithm Registry defined in [RFC5246].

```
enum {
   gostr3411(XX)
} HashAlgorithm;
```
