Abstract

This informational document gives examples of Session Initiation
Protocol (SIP) test messages designed to exercise and "torture" a SIP implementation.

1. Overview

This document is informational, and is NOT NORMATIVE on any aspect of SIP.

This document contains test messages based on the current version (2.0) of the Session Initiation Protocol as defined in [RFC3261]. Some messages exercise SIP’s use of SDP as described in [RFC3264].

These messages were developed and refined at the SIPIt interoperability test events.

The test messages are organized into several sections. Some stress only a SIP parser and others stress both the parser and the application above it. Some messages are valid, and some are not. Each example clearly calls out what makes any invalid messages incorrect.

This document does not attempt to catalog every way to make an invalid message, nor does it attempt to be comprehensive in exploring unusual, but valid, messages. Instead, it tries to focus on areas that have caused interoperability problems or have particularly unfavorable characteristics if they are handled improperly. This document is a seed for a test plan, not a test plan in itself.

The messages are presented in the text using a set of markup conventions to avoid ambiguity and meet Internet-Draft layout requirements. To resolve any remaining ambiguity, a bit-accurate version of each message is encapsulated in an appendix.

2. Document Conventions

This document contains many example SIP messages. Although SIP is a text-based protocol, many of these examples cannot be unambiguously rendered without additional markup due to the constraints placed on the formatting of RFCs. This document defines and uses the markup defined in this section to remove that ambiguity. This markup uses the start and end tag conventions of XML, but does not define any XML document type.

The appendix contains an encoded binary form of all the messages and the algorithm needed to decode them into files.

2.1. Representing Long Lines

Several of these examples contain unfolded lines longer than 72 characters. These are captured between <allOneLine/> tags. The
single unfolded line is reconstructed by directly concatenating all lines appearing between the tags (discarding any line-feeds or carriage returns). There will be no whitespace at the end of lines. Any whitespace appearing at a fold-point will appear at the beginning of a line.

The following represent the same string of bits:

Header-name: first value, reallylongsecondvalue, third value

<allOneLine>
Header-name: first value,
reallylongsecondvalue
, third value
</allOneLine>

<allOneLine>
Header-name: first value,
reallylong
second
value,
third value
</allOneLine>

Note that this is NOT SIP header line folding where different strings of bits have equivalent meaning.

2.2. Representing Non-printable Characters

Several examples contain binary message bodies or header field values containing non-ascii range UTF-8 encoded characters. These are rendered here as a pair of hexadecimal digits per octet between <hex/> tags. This rendering applies even inside quoted-strings.

The following represent the same string of bits:

Header-name: value one

Header-name: value<hex>206F6E</hex>e

The following is a Subject header field containing the euro symbol:

Subject: <hex>E282AC</hex>
2.3. Representing Long Repeating Strings

Several examples contain very large data values created with repeating bit strings. Those will be rendered here using <repeat count=some_integer>value</repeat>. As with <hex> this rendering applies even inside quoted-strings.

For example, the value "abcabcabc" can be rendered as <repeat count=3>abc</repeat>. A display name of "1000000 bottles of beer" could be rendered as

To: "1<repeat count=6><hex>30</hex></repeat> bottles of beer"

<sip:beer.example.com>

and a Max-Forwards header field with a value of one google will be rendered here as

Max-Forwards: 1<repeat count=100>0</repeat>

3. SIP Test Messages

3.1. Parser tests (syntax)

3.1.1. Valid messages

3.1.1.1. A short tortuous INVITE

This short, relatively human-readable message contains:
- line folding all over
- escaped characters within quotes
- an empty subject
- LWS between colons, semicolons, header field values, and other fields
- both comma separated and separate listing of header field values
- mix of short and long form for the same header field name
- unknown Request-URI parameter
- unknown header fields
- unknown header field with a value that would be syntactically invalid if it were defined in terms of generic-param
- unusual header field ordering
- unusual header field name character case
- unknown parameters of a known header field
- uri parameter with no value
- header parameter with no value
- integer fields (Max-Forwards and CSeq) with leading zeros

All elements should treat this as a well-formed request.
The UnknownHeaderWithUnusualValue header field deserves special
attention. If this header field were defined in terms of comma
separated values with semicolon separated parameters (as many of the
existing defined header fields), this would be invalid. However,
since the receiving element does not know the definition of the
syntax for this field, it must parse it as a header-value. Proxies
would forward this header field unchanged. Endpoints would ignore
the header field.

3.1.1.2. Wide range of valid characters

This message exercises a wider range of characters in several key syntactic elements than implementations usually see. Of particular note:

- The Method contains non-alpha characters from token. Note that % is not an escape character for this field. A method of IN%56ITE is an unknown method. It is not the same as a method of INVITE.
- The Request-URI contain unusual, but legal, characters.
- A branch parameter contains all non-alphanumeric characters from token.
- The To header field value’s quoted-string contains quoted-pair expansions, including a quoted NULL character.
- The name part of name-addr in the From header field value contains multiple tokens (instead of a quoted string) with all non-alphanumeric characters from the token production rule. That value also has an unknown header parameter whose name contains the non-alphanumeric token characters and whose value is a non-ascii range UTF-8 encoded string. The tag parameter on this value contains the non-alphanumeric token characters.
- The Call-ID header field value contains the non-alphanumeric characters from word. Notice that in this production:
  * % is not an escape character. (It is only an escape character in productions matching the rule "escaped")
  * " does not start a quoted-string. None of ’, ‘ or " imply that there will be a matching symbol later in the string.
  * The characters [ ] { } ( ) <> do not have any grouping semantics. They are not required to appear in balanced pairs.
- There is an unknown header field (matching extension-header) with non-alphanumeric token characters in its name and a UTF8-NONASCII value.

If this unusual URI has been defined at a proxy, the proxy will forward this request normally. Otherwise a proxy will generate a 404. Endpoints will generate a 501 listing the methods they understand in an Allow header field.
3.1.1.3. Valid use of the % escaping mechanism

This INVITE exercises the % HEX HEX escaping mechanism in several places. The request is syntactically valid. Interesting features include:

- The request-URI has sips:user@example.com embedded in its userpart. What that might mean to example.net is beyond the scope of this document.
- The From and To URIs have escaped characters in their userparts.
- The Contact URI has escaped characters in the URI parameters. Note that the "name" uri-parameter has a value of "value%41" which is NOT equivalent to "valueA". Per [RFC2396], unescaping URI components is never performed recursively.

A parser must accept this as a well-formed message. The application using the message must treat the % HEX HEX expansions as equivalent to the character being encoded. The application must not try to interpret % as an escape character in those places where % HEX HEX
("escaped" in the grammar) is not a valid part of the construction. In [RFC3261], "escaped" only occurs in the expansions of SIP-URI, SIPS-URI, and Reason-Phrase.

3.1.1.4. Escaped nulls in URIs

This register request contains several URIs with nulls in the userpart. The message is well formed - parsers must accept this message. Implementations must take special care when unescaping the Address-of-Record (AOR) in this request to not prematurely shorten the username. This request registers two distinct contact URIs.

3.1.1.5. Use of % when it is not an escape

Most of the places % can appear in a SIP message, it is not an escape character. This can surprise the unwary implementor. The following well-formed request has these properties:
- The request method is unknown. It is NOT equivalent to REGISTER
- The display-name portion of the To and From header fields is "%Z%45". Note that this is not the same as %ZE
- This message has two Contact header field values, not three.
  <sip:alias2@host2.example.com> is a C%6Fntact header field value

A parser should accept this message as well formed. A proxy would forward or reject the message depending on what the Request-URI meant to it. An endpoint would reject this message with a 501.

3.1.1.6. Message with no LWS between display name and <

This OPTIONS request is not valid per the grammar in RFC 3261 since there is no LWS between the quoted string in the display name and < in the From header field value. This has been identified as a specification bug that will be removed when RFC 3261 is revised. Elements should accept this request as well formed.

3.1.1.8. Extra trailing octets in a UDP datagram

This message contains a single SIP REGISTER request, which ostensibly arrived over UDP in a single datagram. The packet contains extra octets after the body (which in this case has zero length). The extra octets happen to look like a SIP INVITE request, but (per section 18.3 of [RFC3261]) they are just spurious noise that must be ignored.

A SIP element receiving this datagram would handle the REGISTER request normally and ignore the extra bits that look like an INVITE request. If the element is a proxy choosing to forward the REGISTER, the INVITE octets would not appear in the forwarded request.

Hello

--7a9cbec02ceef655
Content-Type: application/octet-stream
Content-Transfer-Encoding: binary
3.1.1.12. Unusual reason phrase

This 200 response contains a reason phrase other than "OK". The reason phrase is intended for human consumption, and may contain any string produced by

Reason-Phrase = *(reserved / unreserved / escaped
/ UTF8-NONASCII / UTF8-CONT / SP / HTAB)

This particular response contains unreserved and non-ASCII UTF-8 characters. This response is well formed. A parser must accept this message.
Message Details : unreason

SIP/2.0 200 = 2**3 * 5**2 <hex>D0BDD0BE20D181D182D0BE20D0B4D0B5D0B2D18FD0BDD0BED181D182D0BE20D0B4D0BE20D0B4D0B5D0B2D18FD182D18C202D20D0BFD180D0BED181D182D0BED0B5</hex>

3.1.2. Invalid messages

This section contains several invalid messages reflecting errors seen at interoperability events and exploring important edge conditions that can be induced through malformed messages. This section does not attempt to be a comprehensive list of all types of invalid messages.

3.1.2.1. Extraneous header field separators

The Via header field of this request contains additional semicolons and commas without parameters or values. The Contact header field contains additional semicolons without parameters. This message is syntactically invalid.

An element receiving this request should respond with a 400 Bad Request error.

3.1.2.2. Content length larger than message

This is a request message with a Content Length that is larger than the actual length of the body.

When sent over UDP (as this message ostensibly was), the receiving element should respond with a 400 Bad Request error. If this message arrived over a stream-based transport such as TCP, there's not much
the receiving could do but wait for more data on the stream and close
the connection if none is forthcoming in a reasonable period of time.

3.1.2.3. Negative Content-Length

This request has a negative value for Content-Length.

An element receiving this message should respond with an error. This
request appeared over UDP, so the remainder of the datagram can
simply be discarded. If a request like this arrives over TCP, the
framing error is not recoverable and the connection should be closed.
The same behavior is appropriate for messages that arrive without a
numeric value in the Content-Length header field such as:

    Content-Length: five

Implementors should take extra precautions if the technique they
choose for converting this ascii field into an integral form can
return a negative value. In particular, the result must not be used
as a counter or array index.

3.1.2.4. Request scalar fields with overlarge values

This request contains several scalar header field values outside their legal range.
- the CSeq sequence number is >2**32-1.
- the Max-Forwards value is >255.
- the Expires value is >2**32-1.
- the Contact expires parameter value is >2**32-1.

An element receiving this request should respond with a 400 Bad Request due to the CSeq error. If only the Max-Forwards field were in error, the element could choose process the request as if the field were absent. If only the expiry values were in error, the element could treat them as if they contained the default values for expiration (3600 in this case).

Other scalar request fields that may contain aberrant values include, but are not limited to, the Contact q value, the Timestamp value, and the Via ttl parameter.
Message Details: scalar02

3.1.2.12. Invalid timezone in Date header field

This INVITE is invalid as it contains a non GMT time zone in the SIP Date header field.

It is acceptable to reject this request as malformed (though an element shouldn’t do that unless the contents of the Date header field were actually important to its processing). An element wishing to be liberal in what it accepts could ignore this value altogether if it wasn’t going to use the Date header field anyhow. Otherwise, it could attempt to interpret this date and adjust it to GMT.

RFC 3261 explicitly defines the only acceptable timezone designation as "GMT". "UT", while synonymous with GMT per [RFC2822], is not
valid. "UTC" and "UCT" are also invalid.

3.1.2.13. Failure to enclose name-addr URI in <>

This REGISTER request is malformed. The SIP URI contained in the Contact Header field has an escaped header, so the field must be in name-addr form (which implies the URI must be enclosed in <>).

It is reasonable for an element receiving this request to respond with a 400 Bad Request. An element choosing to be liberal in what it accepts could infer the angle brackets since there is no ambiguity in this example. In general, that won't be possible.

Message Details : regbadct

3.3.2. Request-URI with unknown scheme

This OPTIONS contains an unknown URI scheme in the Request-URI. A parser must accept this as a well-formed SIP request.

An element receiving this request will reject it with a 416 Unsupported URI Scheme response.

Some early implementations attempt to look at the contents of the To header field to determine how to route this kind of request. That is an error. Despite the fact that the To header field and the Request URI frequently look alike in simplistic first-hop messages, the To header field contains no routing information.

Message Details: unkscm

3.3.3. Request-URI with known but atypical scheme

This OPTIONS contains an Request-URI with an IANA registered scheme that does not commonly appear Request-URIs of SIP requests. A parser must accept this as a well-formed SIP request.

If an element will never accept this scheme as meaningful in a request-URI, it is appropriate to treat it as unknown and return a 416 Unsupported URI Scheme response. If the element might accept some URIs with this scheme, then a 404 Not Found is appropriate for those URIs it doesn’t accept.

3.3.4. Unknown URI schemes in header fields

This message contains registered schemes in the To, From and Contact header fields of a request. The message is syntactically valid. Parsers must not fail when receiving this message.

Proxies should treat this message as they would any other request for this URI. A registrar would reject this request with a 400 Bad Request response since the To: header field is required to contain a SIP or SIPS URI as an AOR.

3.3.5. Proxy-Require and Require

This request tests proper implementation of SIP’s Proxy-Require and Require extension mechanisms.

Any element receiving this request will respond with a 420 Bad Extension response containing an Unsupported header field listing these features from either the Require or Proxy-Require header field depending on the role in which the element is responding.

Message Details : bext01

<audio>
<pcmu port="443"/>
</audio>

3.3.7. Unknown authorization scheme

This REGISTER request contains an Authorization header field with an unknown scheme. The request is well-formed. A parser must not fail when receiving it.

A proxy will treat this request as any other REGISTER. If it forwards the request, it will include this Authorization header field unmodified in the forwarded messages.

A registrar that does not care about challenge-response authentication will simply ignore the Authorization header field, processing this registration as if the field were not present. A registrar that does care about challenge-response authentication will reject this request with a 401, issuing a new challenge with a scheme it understands.

Endpoints choosing not to act as registrars will simply reject the request. A 405 Method Not Allowed is appropriate.
3.3.8. Multiple values in single value required fields

The message contains a request with multiple Call-ID, To, From, Max-Forwards and CSeq values. An element receiving this request must not break.

An element receiving this request would respond with a 400 Bad Request error.
Multiple Content-Length values

Multiple conflicting Content-Length header field values appear in this request.

From a framing perspective, this situation is equivalent to an invalid Content-Length value (or no value at all).

An element receiving this message should respond with an error. This request appeared over UDP, so the remainder of the datagram can simply be discarded. If a request like this arrives over TCP, the framing error is not recoverable and the connection should be closed.

200 OK Response with broadcast Via header field value

This message is a response with a 2nd Via header field value’s sent-by containing 255.255.255.255. The message is well formed – parsers must not fail when receiving it.

Per [RFC3261] an endpoint receiving this message should simply discard it.

If a proxy followed normal response processing rules blindly, it would forward this response to the broadcast address. To protect against this being used as an avenue of attack, proxies should drop such responses.

3.3.12. REGISTER with a contact header parameter

This register request contains a contact where the ‘unknownparam’ parameter must be interpreted as being a contact-param and not a url-param.
This REGISTER should succeed. The response must not include "unknownparam" as a url-parameter for this binding. Likewise, "unknownparam" must not appear as a url-parameter in any binding during subsequent fetches.

Behavior is the same, of course, for any known contact-param parameter names.

3.3.15. Unacceptable Accept offering

This request indicates the response must contain a body in an unknown type. In particular, since the Accept header field does not contain application/sdp, the response may not contain an SDP body. The recipient of this request could respond with a 406 Not Acceptable with a Warning/399 indicating that a response cannot be formulated in the formats offered in the Accept header field. It is also appropriate to respond with a 400 Bad Request since all SIP User-Agents (UAs) supporting INVITE are required to support application/sdp.

3.4. Backward compatibility

3.4.1. INVITE with RFC2543 syntax

This is a legal message per RFC 2543 (and several bis versions) which should be accepted by RFC 3261 elements which want to maintain backwards compatibility.

- There is no branch parameter at all on the Via header field value
- There is no From tag
- There is no explicit Content-Length (The body is assumed to be all octets in the datagram after the null-line)
- There is no Max-Forwards header field

4. Security Considerations

This document presents NON NORMATIVE examples of SIP session
establishment. The security considerations in [RFC3261] apply.

Parsers must carefully consider edge conditions and malicious input
as part of their design. Attacks on many Internet systems use
crafted input to cause implementations to behave in undesirable ways.
Many of the messages in this draft are designed to stress a parser
implementation at points traditionally used for such attacks. This
document does not, however, attempt to be comprehensive. It should
be considered a seed to stimulate thinking and planning, not simply a
set of tests to be passed.

5. IANA Considerations

This document has no actions for IANA.

6. Acknowledgments

The final detailed review of this document was performed by: Diego
Besprosvan, Vijay Gurbani, Shashi Kumar, Derek MacDonald, Gautham
Narasimhan, Nils Ohlmeier, Bob Penfield, Reinaldo Penno, Marc Petit-
Huguenin, Richard Sugarman, and Venkatesh Venkataramanan.

Earlier versions of this document were reviewed by: Aseem Agarwal,
Rafi Assadi, Gonzalo Camarillo, Ben Campbell, Cullen Jennings, Vijay
Sparks, et al.

Thanks to Cullen Jennings and Eric Rescorla for their contribution to the multipart/mime sections of this document and their work constructing S/MIME examples in [I-D.jennings-sip-sec-flows]. Thanks to Neil Deason for contributing several messages and Kundan Singh for performing parser validation of messages in earlier versions.

The following individuals provided significant comments during the early phases of the development of this document: Jean-Francois Mule, Hemant Agrawal, Henry Sinnreich, David Devanatham, Joe Pizzimenti, Matt Cannon, John Hearty, the whole MCI IPOP Design team, Scott Orton, Greg Osterhout, Pat Sollee, Doug Weisenberg, Danny Mistry, Steve McKinnon, and Denise Ingram, Denise Caballero, Tom Redman, Ilya Slain, Pat Sollee, John Truetken, and others from MCI, 3Com, Cisco, Lucent and Nortel.

7. Informative References

[I-D.jennings-sip-sec-flows]

Appendix A. Bit-exact archive of each test message

The following text block is an encoded, gzip compressed TAR archive of files that represent each of the example messages discussed in Section 3.
To recover the compressed archive file intact, the text of this document may be passed as input to the following Perl script (the output should be redirected to a file or piped to "tar -xzvf ").

```perl
#!/usr/bin/perl
use strict;
my $bdata = "";
use MIME::Base64;
while(<>) {
    if (/-- BEGIN MESSAGE ARCHIVE --/ .. /-- END MESSAGE ARCHIVE --/) {
        if ( m/\^\s*[^\s]+\s*$/ ) {
            $bdata = "$bdata \$_;
        }
    }
}
print decode_base64($bdata);
```

Figure 58

Alternatively, the base-64 encoded block can be edited by hand to remove document structure lines and fed as input to any base-64 decoding utility.

Intellectual Property Statement

The IETF takes no position regarding the validity or scope of any Intellectual Property Rights or other rights that might be claimed to pertain to the implementation or use of the technology described in this document or the extent to which any license under such rights might or might not be available; nor does it represent that it has made any independent effort to identify any such rights. Information on the procedures with respect to rights in RFC documents can be found in BCP 78 and BCP 79.

Copies of IPR disclosures made to the IETF Secretariat and any assurances of licenses to be made available, or the result of an attempt made to obtain a general license or permission for the use of such proprietary rights by implementers or users of this specification can be obtained from the IETF on-line IPR repository at http://www.ietf.org/ipr.

The IETF invites any interested party to bring to its attention any copyrights, patents or patent applications, or other proprietary rights that may cover technology that may be required to implement this standard. Please address the information to the IETF at ietf-ipr@ietf.org.

Disclaimer of Validity

This document and the information contained herein are provided on an "AS IS" basis and THE CONTRIBUTOR, THE ORGANIZATION HE/SHE REPRESENTS OR IS SPONSORED BY (IF ANY), THE INTERNET SOCIETY AND THE INTERNET ENGINEERING TASK FORCE DISCLAIM ALL WARRANTIES, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO ANY WARRANTY THAT THE USE OF THE INFORMATION HEREIN WILL NOT INFRINGE ANY RIGHTS OR ANY IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE.
