Radio Frequency (RF) Interface Management Information Base
for Data over Cable Service Interface Specifications (DOCSIS) 2.0
Compliant RF Interfaces

Status of This Memo

This document specifies an Internet standards track protocol for the Internet community, and requests discussion and suggestions for improvements. Please refer to the current edition of the "Internet Official Protocol Standards" (STD 1) for the standardization state and status of this protocol. Distribution of this memo is unlimited.

This document revises and obsoletes RFC 2670. Please see Section 5.3 for a description of the changes from RFC 2670.

Abstract

This memo defines a portion of the Management Information Base (MIB) for use with network management protocols in the Internet community. In particular, it defines a set of managed objects for Simple Network Management Protocol (SNMP) based management of the Radio Frequency (RF) interfaces for systems compliant with the Data Over Cable Service Interface Specifications (DOCSIS).

   2.9. DOCSIS ..................................................4
1. The Internet-Standard Management Framework

For a detailed overview of the documents that describe the current Internet-Standard Management Framework, please refer to section 7 of RFC 3410 [RFC3410].

Managed objects are accessed via a virtual information store, termed the Management Information Base or MIB. MIB objects are generally accessed through the Simple Network Management Protocol (SNMP). Objects in the MIB are defined using the mechanisms defined in the Structure of Management Information (SMI). This memo specifies a MIB module that is compliant to the SMIv2, which is described in STD 58, RFC 2578 [RFC2578], STD 58, RFC 2579 [RFC2579] STD 58, RFC 2580 [RFC2580].
2. Glossary

The terms in this document are derived either from normal cable system usage, or from the documents associated with the Data Over Cable Service Interface Specification process.

2.1. Baseline Privacy

Security interface specification, designed for DOCSIS-compliant cable data systems, that ensures device authentication data confidentiality in the CATV plant. See [BPI] and [BPIPLUS].

2.2. CATV

Originally "Community Antenna Television", it now refers to any cable or hybrid fiber and cable system used to deliver video signals to a community.

2.3. Channel

A specific frequency allocation with an RF medium, specified by channel width in Hertz (cycles per second) and by center frequency. Within the US Cable Systems, upstream channels are generally allocated from the 5-42MHz range while downstream channels are generally allocated from the 50-750MHz range, depending on the capabilities of the given system. The typical broadcast channel width in the US is 6MHz. Upstream channel widths for DOCSIS vary.

For European cable systems, upstream channels vary by country. The upper edge of upstream channel allocations varies between 25 MHz to 65 MHz, and the lower edge of downstream channel allocations varies between 47 MHz and 87.5 MHz. The typical broadcast channel width in Europe is 8MHz. The actual parameters are of concern to systems deploying Euro-DOCSIS technology.

The downstream channels conform to the requirements of ITU-T Recommendation J.83 [ITU-T_J.83]

2.4. CM or Cable Modem

A CM acts as a "slave" station in a DOCSIS-compliant cable data system.

2.5. CMTS or Cable Modem Termination System

A generic term covering a cable bridge or cable router in a head-end. A CMTS acts as the master station in a DOCSIS-compliant cable data system. It is the only station that transmits downstream, and it
controls the scheduling of upstream transmissions by its associated CMs.

2.6.  Codeword

A characteristic of the Forward Error Correction scheme, used above the RF media layer.

See "Data-Over-Cable Service Interface Specifications: Radio Frequency Interface Specification SP-RFIv2.0-I10-051209".

2.7.  Data Packet

The payload portion of the MAC Packet.

2.8.  dBmV

A measure of RF signal voltage amplitude, whose power level is determined by the characteristic impedance. A zero dB signal power is equivalent to 48.75 dBmV signal amplitude in a 75 Ohm system.

2.9.  DOCSIS

2.9.1.  DOCSIS 1.0

Cable modem systems that are CM/CMTS compliant to requirements in [RFI1.0]. A common reference to DOCSIS 1.0 in this document is the upstream channel queuing mechanism, known as Class of Service (COS).

2.9.2.  DOCSIS 1.1

Cable modem systems that are CM/CMTS compliant to requirements in [ITU-T_J.112]. DOCSIS 1.1 references in this document are in part associated with the upstream and downstream Quality of Service (QOS). The term DOCSIS 1.x is used in this document to refer to both DOCSIS 1.0 and DOCSIS 1.1.

2.9.3.  DOCSIS 2.0

Cable modem systems that are CM/CMTS compliant to requirements in [ITU-T_J.122]. DOCSIS 2.0 corresponds to the second generation of radio-frequency interface specifications of DOCSIS.
2.10. Downstream

The direction from the head-end towards the subscriber.

2.11. Euro-DOCSIS

Cable modem systems CM/CMTS that conform to the European spectrum lineup and are compliant to requirements of Annex F in [ITU-T_J.122].

2.12. Head-end

The origination point in most cable systems of the subscriber video signals. Generally also the location of the CMTS equipment.

2.13. MAC Packet

A DOCSIS PDU.

2.14. MCNS

"Multimedia Cable Network System". Generally replaced in usage by DOCSIS.

2.15. Mini-slot

In general, an interval of time that is allocated by the CMTS to a given CM for that CM to transmit in an upstream direction. See [ITU-T_J.122]

2.16. QPSK (Quadrature Phase Shift Keying)

A particular modulation scheme on an RF medium. See [Proakis00].

2.17. QAM (Quadrature Amplitude Modulation)

A particular modulation scheme on RF medium. Usually expressed with a number indicating the size of the modulation constellation (e.g., 16 QAM). See [Proakis00].

2.18. RF

Radio Frequency.

2.19. Symbol-times

A characteristic of the RF modulation scheme. See [ITU-T_J.122].
2.20. Upstream

The direction from the subscriber towards the head-end.

3. Overview

This MIB module provides a set of objects required for the management of DOCSIS-compliant Cable Modem (CM) and Cable Modem Termination System (CMTS) RF interfaces. The specification is derived in part from the parameters and protocols described in [ITU-T_J.122].

In this document, the key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" are to be interpreted as described in [RFC2119].

3.1. Textual Conventions

This MIB module defines new textual conventions for CM and CMTS indications of DOCSIS 2.0 RFI capabilities, configuration, usage, and backward compatible modes of operation, as defined in [RFI2.0]. With the same purpose, there are some textual conventions that represent capabilities and modes of operation of [RFI1.1] that are not covered by RFC 2670, and are managed proprietarily in the DOCSIS OSSI 1.1 specification [OSSI1.1].

3.1.1. Textual Conventions in RFC 2670

RFC 2670 defined two textual conventions, TenthdBmV and TenthdB, which are power measurement representations.

3.1.2. Textual Conventions in RFC 4546

This MIB module defines the textual convention DocsisUpstreamType to represent the DOCSIS 1.0 [RFI1.0] and DOCSIS 2.0 [RFI2.0] upstream burst modulation profiles types.

This MIB module defines the textual conventions DocsisVersion and DocsisQosVersion to represent the DOCSIS 1.0 [RFI1.0] and DOCSIS 1.1 [RFI1.1] COS/QOS capabilities and modes of operation.

3.2. Structure of the MIB

This MIB module is structured as three groups:

- Management information pertinent to both Cable Modem (CM) and Cable Modem Termination System (CMTS) (docsIfBaseObjects).
o Management information pertinent to Cable Modem only (docsIfCmObjects).

o Management information pertinent to Cable Modem Termination System only (docsIfCmtsObjects).

Tables within each of these groups cover different functions; e.g., upstream queue services, channel characteristics, MAC layer management, etc. Rows created automatically (e.g., by the device according to the hardware configuration) may and generally will have a mixture of configuration and status objects within them. Rows that are meant to be created by the management station are generally restricted to configuration (read-create) objects.

3.2.1. docsIfBaseObjects

docsIfDownstreamChannelTable - This table describes the existing downstream channels for a CMTS and the received downstream channel for a CM.

docsIfUpstreamChannelTable - This table describes the existing upstream channels for a CMTS and the current upstream transmission channel for a CM.

docsIfQosProfileTable - This table describes the valid Quality of Service profiles for the cable data system.

docsIfSignalQualityTable - This table is used to monitor RF signal quality characteristics of received signals.

docsIfDocsisBaseCapability - This object is used to indicate the highest level of DOCSIS version a cable device can support.

3.2.2. docsIfCmObjects

docsIfCmMacTable - This table is used to monitor the DOCSIS MAC interface and can be considered an extension to the ifEntry.

docsIfCmStatusTable - This table maintains a number of status objects and counters for cable modems. There is a comparable table at the CMTS, docsIfCmtsCmStatusTable, which maintains similar counters from the CMTS point of view.

docsIfCmServiceTable - This table describes the upstream service queues available at this CM. There is a comparable table at the CMTS, docsIfCmtsServiceEntry, which describes the service queues from the point of view of the CMTS.
3.2.3. docsIfCmtsObjects

docsIfCmtsMacTable - Describes the attributes of each CMTS MAC interface.

docsIfCmtsStatusTable - This table provides a set of aggregated counters that roll-up values and events that occur on the underlying sub-interfaces.

docsIfCmtsCmStatusTable - This table is used to hold information about known (i.e., ranging, registered, and/or previously online) cable modems on the system serviced by this CMTS.

docsIfCmtsServiceTable - This table provides access to the information related to upstream service queues.

docsIfCmtsModulationTable - This table allows control over the modulation profiles for RF channels associated with this CMTS.

docsIfCmtsMacToCmTable - This table allows fast access into the docsIfCmtsCmTable via a MAC address (of the CM) interface.

docsIfCmtsChannelUtilizationTable - This table provides statistical load usage data for attached upstream and downstream physical channels.

docsIfCmtsDownChannelCounterTable - This table provides statistical data for attached downstream channels, appropriate as input for load usage calculations.

docsIfCmtsUpChannelCounterTable - This table provides statistical data for attached upstream channels, appropriate as input for load usage calculations.

3.2.4. Relationship to the Interfaces MIB Module

This section clarifies the relationship of this MIB module to the Interfaces MIB [RFC2863]. Several areas of correlation are addressed in the following subsections. The implementer is referred to the Interfaces MIB document in order to understand the general intent of these areas.

3.2.4.1. Layering Model

An instance of ifEntry exists for each RF downstream interface, for each RF upstream interface, for each upstream logical Channel, and for each RF MAC layer.
The ifStackTable [RFC2863] MUST be implemented to identify the relationships among sub-interfaces.

The following example illustrates a CMTS MAC interface with one downstream and two upstream interfaces.

```
<table>
<thead>
<tr>
<th>&lt;= to network layer</th>
</tr>
</thead>
<tbody>
<tr>
<td>RF MAC</td>
</tr>
<tr>
<td>Downstream1</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
</tbody>
</table>
| | | +------------------+
| |                   |
|                   |
|                   |
|                   |
|                   |
|                   |
|                   |
|                   |
|                   |
|                   |
|                   |
|                   |
```

Figure 1

As can be seen from this example, the RF MAC interface is layered on top of the downstream and upstream interfaces, and the RF upstream interface is layered on top of an upstream logical channel.

In this example, the assignment of index values could be as follows:

<table>
<thead>
<tr>
<th>ifIndex</th>
<th>ifType</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>docsCableMaclayer(127)</td>
<td>CATV MAC Layer</td>
</tr>
<tr>
<td>3</td>
<td>docsCableDownstream(128)</td>
<td>CATV Downstream interface</td>
</tr>
<tr>
<td>4</td>
<td>docsCableUpstream(129)</td>
<td>CATV Upstream interface</td>
</tr>
<tr>
<td>5</td>
<td>docsCableUpstream(129)</td>
<td>CATV Upstream interface</td>
</tr>
<tr>
<td>6</td>
<td>docsCableUpstreamChannel(205)</td>
<td>CATV Upstream Channel</td>
</tr>
<tr>
<td>7</td>
<td>docsCableUpstreamChannel(205)</td>
<td>CATV Upstream Channel</td>
</tr>
<tr>
<td>8</td>
<td>docsCableUpstreamChannel(205)</td>
<td>CATV Upstream Channel</td>
</tr>
<tr>
<td>9</td>
<td>docsCableUpstreamChannel(205)</td>
<td>CATV Upstream Channel</td>
</tr>
</tbody>
</table>

Figure 2
The corresponding ifStack entries would then be:

<table>
<thead>
<tr>
<th>IfStackHigherLayer</th>
<th>IfStackLowerLayer</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>2</td>
</tr>
<tr>
<td>2</td>
<td>3</td>
</tr>
<tr>
<td>2</td>
<td>4</td>
</tr>
<tr>
<td>2</td>
<td>5</td>
</tr>
<tr>
<td>4</td>
<td>6</td>
</tr>
<tr>
<td>4</td>
<td>7</td>
</tr>
<tr>
<td>5</td>
<td>8</td>
</tr>
<tr>
<td>5</td>
<td>9</td>
</tr>
<tr>
<td>3</td>
<td>0</td>
</tr>
<tr>
<td>6</td>
<td>0</td>
</tr>
<tr>
<td>7</td>
<td>0</td>
</tr>
<tr>
<td>8</td>
<td>0</td>
</tr>
<tr>
<td>9</td>
<td>0</td>
</tr>
</tbody>
</table>

Figure 3

The same interface model can also be used in Telephony or Telco Return systems. A pure Telco Return system (Cable Modem, as well as Cable Modem Termination System) would not have upstream cable channels, only downstream cable channels. Systems supporting both Telco Return and cable upstream channels can use the above model without modification.

Telco Return upstream channel(s) management is outside the scope of this document.

3.2.4.2. Virtual Circuits

This medium does not support virtual circuits, and this area is not applicable to this MIB module.

3.2.4.3. ifTestTable

The ifTestTable is optional for DOCSIS CM/CMTS implementations, but is not specifically influenced by the RF MIB.

3.2.4.4. ifRcvAddressTable

The ifRcvAddressTable is optional for DOCSIS CM/CMTS implementations, but is not specifically influenced by the RF MIB.
3.2.4.5. ifEntry

This section documents only the differences from the requirements specified in the Interfaces MIB module. See that MIB module for columns omitted from the descriptions below.

3.2.4.5.1. ifEntry for Downstream Interfaces

The ifEntry for downstream interfaces supports the ifGeneralInformationGroup and the ifPacketGroup of the Interfaces MIB module. This is an output-only interface at the CMTS, and all input status counters — ifIn* — will return zero. This is an input-only interface at the CM, and all output status counters — ifOut* — will return zero.

3.2.4.5.1.1. ifEntry for Downstream Interfaces in Cable Modem Termination System

<table>
<thead>
<tr>
<th>ifTable</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>ifIndex</td>
<td>Each CATV Downstream interface is represented by an ifEntry.</td>
</tr>
<tr>
<td>ifType</td>
<td>The IANA value of docsCableDownstream(128).</td>
</tr>
<tr>
<td>ifSpeed</td>
<td>Return the speed of this downstream channel. The returned value is the raw bandwidth in bits/s of this interface. This is the symbol rate multiplied with the number of bits per symbol.</td>
</tr>
<tr>
<td>ifHighSpeed</td>
<td>Return the speed of this downstream channel. The returned value is the raw bandwidth in megabits/s of this interface. This is the symbol rate multiplied with the number of bits per symbol.</td>
</tr>
<tr>
<td>ifPhysAddress</td>
<td>Return the zero-length OCTET STRING.</td>
</tr>
<tr>
<td>ifAdminStatus</td>
<td>The administrative status of this interface.</td>
</tr>
<tr>
<td>ifOperStatus</td>
<td>The current operational status of this interface.</td>
</tr>
<tr>
<td>ifMtu</td>
<td>The size of the largest frame that can be sent on this interface, specified in octets. The value includes the length of the MAC header.</td>
</tr>
<tr>
<td>ifInOctets</td>
<td></td>
</tr>
<tr>
<td>ifHCInOctets</td>
<td>Return zero.</td>
</tr>
</tbody>
</table>
ifInUcastPkts
ifHCInUcastPkts  Return zero.

ifInMulticastPkts
ifHCInMulticastPkts
Return zero.

ifInBroadcastPkts
ifHCInBroadcastPkts
Return zero.

ifInDiscards
Return zero.

ifInErrors
Return zero.

ifInUnknownProtos
Return zero.

ifOutOctets
ifHCOutOctets  The total number of octets transmitted on this interface. This includes MAC packets as well as data packets, and includes the length of the MAC header.

ifOutUcastPkts
ifHCOutUcastPkts  The number of unicast packets transmitted on this interface. This includes MAC packets as well as data packets.

ifOutMulticastPkts
ifHCOutMulticastPkts
Return the number of multicast packets transmitted on this interface. This includes MAC packets as well as data packets.

ifOutBroadcastPkts
ifHCOutBroadcastPkts
Return the number of broadcast packets transmitted on this interface. This includes MAC packets as well as data packets.

ifOutDiscards
The total number of outbound packets which were discarded. Possible reasons are: buffer shortage.

ifOutErrors
The number of packets that could not be transmitted due to errors.

ifPromiscuousMode
Return false.
3.2.4.5.1.2. ifEntry for Downstream Interfaces in Cable Modem

<table>
<thead>
<tr>
<th>ifTable</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>ifIndex</td>
<td>Each CATV Downstream interface is represented by an ifEntry.</td>
</tr>
</tbody>
</table>

- **ifType**
  - The IANA value of docsCableDownstream(128).

- **ifSpeed**
  - Return the speed of this downstream channel. The returned value the raw bandwidth in bits/s of this interface. This is the symbol rate multiplied with the number of bits per symbol.

- **ifHighSpeed**
  - Return the speed of this downstream channel. The returned value the raw bandwidth in megabits/s of this interface. This is the symbol rate multiplied with the number of bits per symbol.

- **ifPhysAddress**
  - Return the zero-length OCTET STRING.

- **ifAdminStatus**
  - The administrative status of this interface.

- **ifOperStatus**
  - The current operational status of this interface.

- **ifMtu**
  - The size of the largest frame that can be received from this interface, specified in octets. The value includes the length of the MAC header.

- **ifInOctets**
  - The total number of octets received on this interface. This includes data packets as well as MAC packets, and includes the length of the MAC header.

- **ifHCInOctets**
  - Return the number of unicast packets received on this interface. This includes data packets as well as MAC packets.

- **ifInMulticastPkts**
  - Return the number of multicast packets received on this interface. This includes data packets as well as MAC packets.
ifInBroadcastPkts
ifHCInBroadcastPkts
Return the number of broadcast packets received on this interface. This includes data packets as well as MAC packets.

ifInDiscards
The total number of received packets that have been discarded. The possible reasons are: buffer shortage.

ifInErrors
The number of inbound packets that contained errors preventing them from being deliverable to higher layers. Possible reasons are: MAC FCS error.

ifInUnknownProtos
The number of frames with an unknown packet type. These are MAC frames with an unknown packet type.

ifOutOctets
Return zero.
ifHCOutOctets

ifOutUcastPkts
Return zero.
ifHCOutUcastPkts

ifOutMulticastPkts
Return zero.
ifHCOutMulticastPkts

ifOutBroadcastPkts
Return zero.
ifHCOutBroadcastPkts

ifOutDiscards
Return zero.

ifOutErrors
Return zero.

ifPromiscuousMode
Refer to the Interfaces MIB.

3.2.4.5.2. ifEntry for Upstream Interfaces

Each supported interface of the type docsCableUpstream(129) must have a corresponding ifEntry. The ifEntry for upstream interfaces supports the ifGeneralInformationGroup and the ifPacketGroup of the Interfaces MIB. This is an input-only interface at the CMTS, and all output status counters -- ifOut* -- will return zero. This is an output only interface at the CM, and all input status counters -- ifIn* -- will return zero.
### 3.2.4.5.2.1. ifEntry for Upstream Interfaces in Cable Modem Termination System

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ifTable</td>
<td>Comments</td>
</tr>
<tr>
<td>ifIndex</td>
<td>Each RF Cable Upstream interface is represented by an ifEntry.</td>
</tr>
<tr>
<td>ifType</td>
<td>The IANA value of docsCableUpstream (129).</td>
</tr>
<tr>
<td>ifSpeed</td>
<td>Return the maximum channel throughput (not payload throughput) supported by the interface. The maximum throughput is calculated for the case where upstream channels are configured to maximize interface throughput.</td>
</tr>
<tr>
<td>ifHighSpeed</td>
<td>Return the maximum channel throughput (not payload throughput) supported by the interface. The maximum throughput is calculated for the case where upstream channels are configured to maximize interface throughput. Units for this object are ((1/1 \ 000 \ 000) \times \text{IfSpeed}).</td>
</tr>
<tr>
<td>ifPhysAddress</td>
<td>Return the zero-length OCTET STRING.</td>
</tr>
<tr>
<td>ifAdminStatus</td>
<td>The administrative status of this interface.</td>
</tr>
<tr>
<td>ifOperStatus</td>
<td>The current operational status of this interface. This reflects the total status of all the channels under this interface. So if at least one channel has a physical connection this interface has connection.</td>
</tr>
<tr>
<td>ifMtu</td>
<td>The size of the largest frame that can be transmitted on this interface, specified in octets. The value includes the length of the MAC header. This is the maximum of all the ifMtu of all the channels under this interface.</td>
</tr>
<tr>
<td>ifInOctets</td>
<td>The total (sum) number of octets received on all the upstream channels under this interface. This includes data packets as well as MAC packets, and includes the length of the MAC header.</td>
</tr>
</tbody>
</table>
ifInUcastPkts ifHCInUcastPkts
The total number of unicast packets received on all the upstream channels under this interface. This includes data packets as well as MAC packets.

ifInMulticastPkts ifHCInMulticastPkts
Return the total number of multicast packets received on all the upstream channels under this interface. This includes data packets as well as MAC layer packets.

ifInBroadcastPkts ifHCInBroadcastPkts
Return the total number of broadcast packets received on all the upstream channels under this interface. This includes data packets as well as MAC packets.

ifInDiscards
The total number of received packets that have been discarded on all the upstream channels under this interface. The possible reasons are: buffer shortage.

ifInErrors
The total number of inbound packets that contained errors preventing them from being deliverable to higher layers. Possible reasons are: MAC FCS error.

ifInUnknownProtos
The total number of frames with an unknown packet type. These are MAC frames with an unknown packet type.

ifOutOctets ifHCOutOctets
Return zero.

ifOutUcastPkts ifHCOutUcastPkts
Return zero.

ifOutMulticastPkts ifHCOutMulticastPkts
Return zero.

ifOutBroadcastPkts ifHCOutBroadcastPkts
Return zero.
ifOutDiscards    Return zero.
ifOutErrors      Return zero.

3.2.4.5.2.2. ifEntry for Upstream Interfaces in Cable Modem

<table>
<thead>
<tr>
<th>Comments</th>

</tbody>
</table>
ifInErrors Return zero.

ifInUnknownProtos Return zero.

ifOutOctets
ifHCOOutOctets The total number of octets transmitted on this interface. This includes MAC packets as well as data packets, and includes the length of the MAC header.

ifOutUcastPkts
ifHCOOutUcastPkts The number of unicast packets transmitted on this interface. This includes MAC packets as well as data packets.

ifOutMulticastPkts
ifHCOOutMulticastPkts Return the number of multicast packets transmitted on this interface. This includes MAC packets as well as data packets.

ifOutBroadcastPkts
ifHCOOutBroadcastPkts Return the number of broadcast packets transmitted on this interface. This includes MAC packets as well as data packets.

ifOutDiscards The total number of outbound packets that were discarded. Possible reasons are: buffer shortage.

ifOutErrors The number of packets that could not be transmitted due to errors.

ifPromiscuousMode Return false.

3.2.4.5.3. ifEntry for Upstream Channels

Each supported channel of the type docsCableUpstreamChannel(205) must have a corresponding ifEntry.

The ifEntry for upstream channels supports the ifGeneralInformationGroup and the ifPacketGroup of the Interfaces MIB. This is an input only interface at the CMTS and all output status counters -- ifOut* -- will return zero. DOCSIS CMs are not required to support logical upstream channels.
3.2.4.5.3.1. ifEntry for Upstream Channels in Cable Modem Termination System

<table>

ifOutErrors
Return zero.

3.2.4.5.4. ifEntry for the MAC Layer

The ifEntry for the MAC Layer supports the ifGeneralInformationGroup and the ifPacketGroup of the Interfaces MIB. This interface provides an aggregate view of status for the lower level downstream and upstream interfaces.

ifTable
Comments

ifIndex
Each RF Cable MAC layer entity is represented by an ifEntry.
ifType
   The IANA value of docsCableMaclayer(127).

ifSpeed
   Return zero.

ifPhysAddress
   Return the physical address of this interface.

ifAdminStatus
   The administrative status of this interface.

ifOperStatus
   The current operational status of the MAC layer interface.

ifHighSpeed
   Return zero.

ifMtu
   Return 1500.

ifInOctets
   The total number of data octets received on this interface, targeted for upper protocol layers.

ifHCInOctets
   The total number of data octets received on this interface, targeted for upper protocol layers.

ifInUcastPkts
   The number of unicast packets received on this interface, targeted for upper protocol layers.

ifHCInUcastPkts
   The number of unicast packets received on this interface, targeted for upper protocol layers.

ifInMulticastPkts
   Return the number of multicast packets received on this interface, targeted for upper protocol layers.

ifHCInMulticastPkts
   Return the number of multicast packets received on this interface, targeted for upper protocol layers.

ifInBroadcastPkts
   Return the number of broadcast packets received on this interface, targeted for upper protocol layers.

ifHCInBroadcastPkts
   Return the number of broadcast packets received on this interface, targeted for upper protocol layers.

ifInDiscards
   The total number of received packets that have been discarded. The possible reasons are: buffer shortage.

ifInErrors
   The number of inbound packets that contained errors preventing them from being deliverable to higher layers. Possible reasons are: data packet FCS error, invalid MAC header.

ifInUnknownProtos
   The number of frames with an unknown packet type. This is the number of data packets targeted for upper protocol layers with an unknown packet type.
3.2.5. Offline Upstream Parameters Handling

3.2.5.1. Overview

This section describes the offline configuration of the DOCSIS 2.0 upstream logical interface parameters. The purpose of this feature is to guarantee that upstream logical interface parameters (such as modulation profile, channel type, mini-slot size, and SCDMA attributes) are consistent prior to committing changes to an active upstream logical interface. This mechanism can reduce possible downtime of the upstream interface by minimizing SNMP SET operations to in-service upstream interfaces. This mechanism is supported by CMTSs and is not applicable to CMs.

3.2.5.2. Operation

This mechanism uses three upstream channel MIB objects defined for DOCSIS 2.0 CMTS implementations:

- ifOutOctets: The total number of octets, received from upper protocol layers and transmitted on this interface.
- ifHCOutOctets: The number of unicast packets, received from upper protocol layers and transmitted on this interface.
- ifOutMulticastPkts: Return the number of multicast packets received from upper protocol layers and transmitted on this interface.
- ifHCOutMulticastPkts: Return the number of broadcast packets received from upper protocol layers and transmitted on this interface.
- ifOutDiscards: The total number of outbound packets that were discarded. Possible reasons are: buffer shortage.
- ifOutErrors: The number of packets that could not be transmitted due to errors.
- ifPromiscuousMode: Refer to the Interfaces MIB.
docsIfUpChannelStatus - The RowStatus object for the creation of temporary interfaces in the upstream interface table. A temporary entry is used to modify, validate, and commit upstream parameters of a physical interface. In the CMTS, a physical upstream interface refers to an upstream logical channel interface.

docsIfUpChannelCloneFrom - This MIB object associates a physical interface with a temporary interface for the purpose of updating the upstream parameters of the physical interface.

docsIfUpChannelUpdate - This MIB object is the commit object that transfers the validated upstream parameters from the temporary interface to the physical interface.

The offline upstream parameters handling operation is as follows:

- A temporary interface is created in which docsIfUpChannelStatus is set to 'createAndWait', which turns the new create entry status to 'notReady'.

- A SET to docsIfUpChannelCloneFrom in the temporary interface to the physical interface ifIndex value performs two actions:
  * Creates the association of the physical interface to the temporary interface.
  * Copies the original upstream parameters from the physical interface to the temporary interface, which turns its status to 'notInService'.

- The operator modifies the temporary interface parameters to the desired values.

- At this point, a SET to 'active' to the RowStatus of the temporary interface is successful if all parameters in the temporary interface are valid for the associated physical interface; otherwise, the temporary entry remains with status 'notInService', and the SET returns the error 'commitFailed'.

- When the temporary interface status is 'active', a SET to docsIfUpChannelUpdate to 'true' transfers the temporary interface parameters values to the physical interface.

- After completion of the update operations, the temporary interface is destroyed, setting the docsIfUpChannelStatus to 'destroy'.
3.2.5.3. Relation of docsIfUpChannelStatus and ifMib

The main purpose of docsIfUpChannelStatus is the creation of temporary interfaces for offline handling of the configuration of physical interfaces; it does not manage the creation or control of physical interfaces. To maintain a consistent operation and status report of interfaces, this object does not manage the administrative and operational status of physical interfaces.

LAST-UPDATED "200605240000Z" -- May 24, 2006

ORGANIZATION "IETF IPCDN Working Group"

CONTACT-INFO
"This is the MIB Module for DOCSIS 2.0-compliant Radio Frequency (RF) interfaces in Cable Modems and Cable Modem Termination Systems.

Copyright (C) The Internet Society (2006). This version of this MIB module is part of RFC 4546; see the RFC itself for full legal notices."

"Revision of the IETF RF MIB module for DOCSIS 2.0. This version published as RFC 4546. This MIB module revision includes the following among others:
Usage of ifType (205) for upstream logical channels.
Addition of downstream and upstream utilization counters.
Additional statistics per upstream interface.
Upstream channel offline configuration mechanism.
Added MIB support for new DOCSIS 2.0 modulation attributes.
Euro-DOCSIS downstream interleave values.
Adjustments to RFC 2670 definitions based on the MIB review guidelines from the IETF"
Operations and Management Area (OPS).

REVISION "199908190000Z"
DESCRIPTION
"Initial version, published as RFC 2670.
Modified by Mike St. Johns to fix problems identified by
the first pass of the MIB doctor. Of special note,
docsIfRangingResp and docsIfCmtsInsertionInterval were
obsoleted and replaced by other objects with the same
functionality, but with more appropriate syntax."

'tdmaAndAtdma' is related to simultaneous support of TDMA and A-TDMA modes."
SYNTAX INTEGER {
unknown (0),
tdma (1),
atdma (2),
scdma (3),
tdmaAndAtdma (4)
}

DocsEqualizerData ::= TEXTUAL-CONVENTION
STATUS current
DESCRIPTION
"This data type represents the equalizer data as measured at the receiver interface. The format of the equalizer follows the structure of the Transmit Equalization Adjust RNG-RSP TLV of DOCSIS RFI v2.0:
1 byte Main tap location 1..(n + m)
1 byte Number of forward taps per symbol
1 byte Number of forward taps: n
1 byte Number of reverse taps: m

Following are the equalizer coefficients:
First, forward taps coefficients:
2 bytes F1 (real), 2 bytes F1 (imag)
2 bytes \( F_n \) (real), 2 bytes \( F_n \) (imag)

Then, reverse taps coefficients:
2 bytes \( D_1 \) (real), 2 bytes \( D_1 \) (imag)

... 
2 bytes \( D_m \) (real), 2 bytes \( D_m \) (imag)

The equalizer coefficients are considered signed 16-bit integers in the range from \(-32768 \) (0x8000) to 32767 (0x7FFF).

DOCSIS specifications require up to a maximum of 64 equalizer taps \((n + m)\); therefore, this object size can get up 260 bytes \((4 + 4x64)\).

The minimum object size (other than zero) for a t-spaced tap with a minimum of 8 symbols will be 36 \((4 + 4x8)\).

STATUS      current
DESCRIPTION
 "List of attributes for a single upstream channel. For
 DOCSIS 2.0 CMTSs, an entry in this table exists for
 each ifEntry with an ifType of docsCableUpstreamChannel
 (205).
 For DOCSIS 1.x CM/CMTSs and DOCSIS 2.0 CMs, an entry in
 this table exists for each ifEntry with an ifType of
docsCableUpstream (129).

 For DOCSIS 2.0 CMTSs, two classes of interfaces can be
 defined for this table:
 o Upstream Physical Interfaces: The traditional DOCSIS
  1.x CMTS upstream interface ifType 129 and the DOCSIS
  2.0 ifType 205 that are functional. In other words,
  interfaces that represent upstream receivers within
  an RF MAC interface.
  Entries of physical interfaces are exposed to the
  management interface with their corresponding
  ifStack hierarchy and are not administratively
  created by this table.
o Upstream Temporary Interfaces: A fictitious interface created for the purpose of manipulating physical interface parameters offline, then validating prior to updating the target physical interface.

In case of a reinitialization of the managed system, physical interfaces values persist while the temporary interfaces are not recreated.

This mechanism helps to minimize service disruptions originating in situations where a group of interface parameter values need to be consistent with each other in SET operations. A temporary buffer (temporary interface) is provided to allow the CMTS to validate the parameters offline.

docsIfUpChannelCloneFrom OBJECT-TYPE
SYNTAX      InterfaceIndexOrZero
MAX-ACCESS  read-create
STATUS      current
DESCRIPTION
"This object contains the ifIndex value of the physical interface row entry whose parameters are to be adjusted.

Upon setting this object to the ifIndex value of a physical interface, the following interface objects values are copied to this entry:
docsIfUpChannelFrequency,
docsIfUpChannelWidth,
docsIfUpChannelModulationProfile,
docsIfUpChannelSlotSize,
docsIfUpChannelRangingBackoffStart,
docsIfUpChannelRangingBackoffEnd,
docsIfUpChannelTxBackoffStart,
docsIfUpChannelTxBackoffEnd,
docsIfUpChannelScdmaActiveCodes,
docsIfUpChannelScdmaCodesPerSlot,
docsIfUpChannelScdmaFrameSize,
docsIfUpChannelScdmaHoppingSeed,
docsIfUpChannelType, and
docsIfUpChannelPreEqEnable

Setting this object to the value of a non-existent or a temporary upstream interface returns the error 'wrongValue'.

This object MUST contain a value of zero for physical interfaces entries.

Setting this object in row entries that correspond to physical interfaces returns the error 'wrongValue'."

::= { docsIfUpstreamChannelEntry 16 }

docsIfUpChannelUpdate OBJECT-TYPE
SYNTAX      TruthValue
MAX-ACCESS  read-create
STATUS      current
DESCRIPTION
"Used to perform the copy of adjusted parameters from the temporary interface entry to the physical interface indicated by the docsIfUpChannelCloneFrom object. The transfer is initiated through an SNMP SET to 'true' of
this object.
A SET to 'true' fails and returns error 'commitFailed'
if docsIfUpChannelStatus value is 'notInService', which
means that the interface parameters values are not
compatible with each other or have not been validated yet.
Reading this object always returns 'false'."

::= { docsIfUpstreamChannelEntry 17 }

docsIfUpChannelStatus OBJECT-TYPE
SYNTAX RowStatus
MAX-ACCESS read-create
STATUS current
DESCRIPTION
"This object is only used for the creation of a temporary
upstream row with the purpose of updating the parameters
of a physical upstream channel entry.

The following restrictions apply to this object:
1. This object is not writable for physical interfaces.
2. Temporary interface entries are only created by a SET
   of this object to createAndWait(5).
3. ifAdminStatus from the Interface MIB RFC 2863 is used
to take a physical upstream channel offline, to be
consistent with DOCSIS 1.x operation, as indicated in
RFC 2670.
   In addition,
   o ifAdminStatus 'down' is reflected in this object
     as 'notInService'.
   o ifOperStatus 'down' while ifAdminStatus 'up' is
     reflected in this object as 'notInService'.
4. Temporary created rows MUST be set to 'active' with
the purpose of validating upstream parameter
consistency prior to transferring the parameters to the
physical interface.

Below is a mandatory procedure for adjusting the values
of a physical interface:
1. Create a temporary interface entry through an SNMP SET
   using 'createAndWait'. At this point, the RowStatus
   reports 'notReady'.
   The Manager entity uses an ifIndex value outside the
   operational range of the physical interfaces for the
   creation of a temporary interface.
2. Set the docsIfUpChannelCloneFrom object to the ifIndex
   value of the physical row to update. Now
docsIfUpChannelStatus reports 'notInService'.
3. Change the upstream parameters to the desired values
   in the temporary row.
4. Validate that all parameters are consistent by setting docsIfUpChannelStatus to ‘active’. A failure to set the RowStatus to ‘active’ returns the error 'commitFailed’, which means the parameters are not compatible with the target physical interface.

5. With docsIfUpChannelStatus ‘active’, transfer the parameters to the target physical interface by setting the object docsIfUpChannelUpdate to ‘true’.

6. Delete the temporary row by setting docsIfUpChannelStatus to ‘destroy’.

DESCRIPTION
"Current Cable Modem connectivity state, as specified in the RF Interface Specification. Interpretations for state values 1-12 are clearly outlined in the SP-RFI reference given below.
The state value accessDenied(13) indicates the CMTS has sent a Registration Aborted message to the CM. The same state is reported as accessDenied(7) by the CMTS object docsIfCmtsCmStatusValue."

   registeredBPIInitializing(9)
}
MAX-ACCESS  read-only
STATUS      current
DESCRIPTION
   "Current cable modem connectivity state, as specified in the RF Interface Specification. Returned status information is the CM status, as assumed by the CMTS, and indicates the following events:
other(1)
   Any state other than below.
ranging(2)
   The CMTS has received an Initial Ranging Request message from the CM, and the ranging process is not yet complete.
rangingAborted(3)
   The CMTS has sent a Ranging Abort message to the CM."
rangingComplete(4)
The CMTS has sent a Ranging Complete message to the CM.

ipComplete(5)
The CMTS has received a DHCP reply message and forwarded it to the CM.

registrationComplete(6)
The CMTS has sent a Registration Response message to the CM.

accessDenied(7)
The CMTS has sent a Registration Aborted message to the CM.

operational(8)
Value 8 is considered reserved and should not be defined in future revisions of this MIB module to avoid conflict with documented implementations that support value 8 to indicate operational state after completing the BPI initialization process.

registeredBPIInitializing(9)
Baseline Privacy (BPI) is enabled and the CMTS is in the process of completing BPI initialization. This state MAY last for a significant length of time if failures occur during the initialization process. After completion of BPI initialization, the CMTS will report registrationComplete(6).
The CMTS only needs to report states it is able to detect.

-- The following independent object and associated table provide
-- operators with a mechanism to evaluate the load/utilization of
-- both upstream and downstream physical channels. This information
-- may be used for capacity planning and incident analysis and may
-- be particularly helpful in provisioning of high value QOS.
--
-- Utilization is expressed as an index representing the calculated
-- percentage utilization of the upstream or downstream channel in
-- the most recent sampling interval (i.e., utilization interval).
-- Refer to the DESCRIPTION field of the
-- docsIfCmtsChannelUtilization object for definitions and
-- calculation details.

docsIfCmtsChannelUtilizationInterval OBJECT-TYPE
SYNTAX     Integer32 (0..86400)
UNITS       "seconds"
MAX-ACCESS read-write
STATUS     current
DESCRIPTION
"The time interval in seconds over which the channel
utilization index is calculated. All upstream/downstream
channels use the same
docsIfCmtsChannelUtilizationInterval.
Setting a value of zero disables utilization reporting. A channel utilization index is calculated over a fixed window applying to the most recent docsIfCmtsChannelUtilizationInterval. It would therefore be prudent to use a relatively short docsIfCmtsChannelUtilizationInterval. It is a vendor decision whether to reset the timer when docsIfCmtsChannelUtilizationInterval is changed during a utilization sampling period.

docsIfCmtsChannelUtUtilization OBJECT-TYPE
SYNTAX       Integer32 (0..100)
UNITS        "percent"
MAX-ACCESS   read-only
STATUS       current
DESCRIPTION   "The calculated and truncated utilization index for this
physical upstream or downstream channel, accurate as of
the most recent docsIfCmtsChannelUtilizationInterval.

Upstream Channel Utilization Index:

The upstream channel utilization index is expressed as a
percentage of mini-slots utilized on the physical channel,
regardless of burst type. For an Initial Maintenance
region, the mini-slots for the complete region are
considered utilized if the CMTS received an upstream
burst within the region from any CM on the physical
channel. For contention REQ and REQ/DATA regions, the
mini-slots for a transmission opportunity within the
region are considered utilized if the CMTS received an
upstream burst within the opportunity from any CM on the
physical channel. For all other regions, utilized
mini-slots are those in which the CMTS granted
bandwidth to any unicast SID on the physical channel.

For an upstream interface that has multiple logical
upstream channels enabled, the utilization index is a
weighted sum of utilization indices for the logical
channels. The weight for each utilization index is the
percentage of upstream mini-slots allocated for the
corresponding logical channel.

Example:
If 75% of bandwidth is allocated to the first logical
channel and 25% to the second, and the utilization
indices for each are 60 and 40, respectively, the
utilization index for the upstream physical channel is 

\[(60 \times 0.75) + (40 \times 0.25) = 55\]. This figure applies to the most recent utilization interval.

**Downstream Channel Utilization Index:**

The downstream channel utilization index is a percentage expressing the ratio between bytes used to transmit data versus the total number of bytes transmitted in the raw bandwidth of the MPEG channel. As with the upstream utilization index, the calculated value represents the most recent utilization interval.

Formula:

\[
\text{Downstream utilization index} = \frac{100 \times (\text{data bytes} / \text{raw bytes})}{100}
\]

Definitions:

Data bytes: Number of bytes transmitted as data in the docsIfCmtsChannelUtilizationInterval. Identical to docsIfCmtsDownChannelCtrUsed Bytes measured over the utilization interval.

Raw bandwidth: Total number of bytes available for transmitting data, not including bytes used for headers and other overhead.

Raw bytes: \((\text{raw bandwidth} \times \text{docsIfCmtsChannelUtilizationInterval})\). Identical to docsIfCmtsDownChannelCtrTotal Bytes measured over the utilization interval.

OBJECT  docsIfUpChannelScdmaActiveCodes
MIN-ACCESS  read-only
DESCRIPTION
"Read-create in cable modem termination systems;
read-only in cable modems.
The number of active codes when SCDMA is in use MUST range
from 64 to 128 and MUST be a non-Prime value.
Providing this range allows for the following features
and capabilities:
1) Power management in S-CDMA spreader-on frames
(with a 3 dB spread)."
2) Avoidance of code 0.
3) Flexible mini-slot sizes with and without the use of code 0."

5. Revision History

5.1. Scope

The MIB module in this document has been developed to accommodate DOCSIS 2.0 devices and their system capabilities. The MIB module is an update to RFC 2670 [RFC2670] with the additional incorporation of DOCSIS 2.0 [RFI2.0] and Euro-DOCSIS specification requirements [EN-300-429].

5.2. Extension

We have maintained the MIB objects as defined in RFC 2670 [RFC2670]. In some cases new MIB objects have been created with identical functionality but greater capacity (i.e., 32 to 64 bits). In these situations, both the original 32 bit objects and the new 64 bit objects must be implemented.

6. Security Considerations

This MIB module relates to a system that will provide metropolitan public internet access. As such, improper manipulation of the MIB objects represented by this MIB module may result in denial of service to a large number of end-users.

There are a number of management objects defined in this MIB that have a MAX-ACCESS clause of read-write or read-create. Such objects may be considered sensitive or vulnerable in some network environments. The support for SET operations in a non-secure environment without proper protection can have a negative effect on network operations.

The CMTS is the controller of most of the parameters of the DOCSIS RFI Interface. Therefore, write access to the CMTS MIB objects may compromise the end-user’s services.

In the CM case, the only read-write object of this MIB module is docsIfCmRangingTimeout, which if SET maliciously, may not constitute a critical factor of service degradation.

The rest of the CM-required MIB objects in this MIB module are read-only, either by definition, or by compliance statements.

The CMTS is the controller of most of the parameters of the DOCSIS RFI Interface. Below are the CMTS MIB object’s vulnerabilities:

- Objects in the docsIfBasicGroupv2, if SET maliciously, could result in a denial of service. Particularly, SETs to objects in
docsIfDownstreamChannelTable, docsIfUpstreamChannelTable, docsIfCmstsModulationTable, and docsIfQosProfileTable (the last one in conjunction with the MIB object docsIfCmstsQosProfilePermissions) can alter negatively the physical and link layer parameters of upstream and downstream channels.

- The Object docsIfCmstsServiceAdminStatus of the docsIfCmstsGroupv2 group, when SET maliciously by an attacker to 'disabled' or 'destroyed', will interrupt the service of the corresponding cable modem.

Some of the readable objects in this MIB module (i.e., objects with a MAX-ACCESS other than not-accessible) may be considered sensitive or vulnerable in some network environments. It is thus important to control even GET and/or NOTIFY access to these objects and possibly to even encrypt the values of these objects when sending them over the network via SNMP. Below are some sensitivity considerations:

- Read access to the MIB objects in tables docsIfCmStatusTable (CM), docsIfSignalQualityTable (CM/CMTS) and in CMTS tables docsIfCmstsCmStatusTable, docsIfCmstsChannelUtilizationTable, docsIfCmstsDownChannelCounterTable, and docsIfCmstsUpChannelCounterTable, could reveal information about the cable modems' distribution among the upstream and downstream channels and their performance, which could be used to gain access to a different tiered service offer. The table docsIfCmstsCmStatusTable also contains the MAC and IP addresses of the cable modems, which can be used for theft of service.

SNMP versions prior to SNMPv3 did not include adequate security. Even if the network itself is secure (for example by using IPSec), even then, there is no control as to who on the secure network is allowed to access and GET/SET (read/change/create/delete) the objects in this MIB module.

It is RECOMMENDED that implementers consider the security features as provided by the SNMPv3 framework (see [RFC3410], section 8), including full support for the SNMPv3 cryptographic mechanisms (for authentication and privacy).

Further, deployment of SNMP versions prior to SNMPv3 is NOT RECOMMENDED. Instead, it is RECOMMENDED to deploy SNMPv3 and to enable cryptographic security. It is then a customer/operator responsibility to ensure that the SNMP entity giving access to an instance of this MIB module is properly configured to give access to the objects only to those principals (users) that have legitimate rights to indeed GET or SET (change/create/delete) them.
7. Management Interoperability of DOCSIS 1.0, 1.1, and 2.0

The MIB module contained in this document updates RFC 2670 [RFC2670], primarily to handle the management requirements of the DOCSIS RF Interface of DOCSIS 2.0 [ITU-T_J.122]. RFC 2670 contains the DOCSIS RF Interface management requirements for DOCSIS 1.0 and DOCSIS 1.1.

The management requirements of Class of Service (DOCSIS 1.0) pertaining to RFC 2670 are the same as this document update and are contained in the tables docsIfQosProfileTable, docsIfCmServiceTable, and docsIfCmtsServiceTable.

DOCSIS 1.1 and DOCSIS 2.0 Quality of Service management requirements are defined in the DOCSIS management specifications [OSSI1.1] and [OSSI2.0], respectively.
